

FITTRACK AI

Phase 1.3 — Empathy Map Canvas

Brainstorming & Ideation Documentation | Source: Main Project Document

1. Persona Identification

Primary Persona: Authenticated Fitness User

The project document identifies one primary role: the Authenticated User. The scenario-based case study represents this role through Rahul, a fitness enthusiast who exercises regularly, maintains a fitness routine, and currently records workouts manually using notebooks and spreadsheets. The empathy map therefore focuses on the documented needs and challenges of this user type rather than introducing additional personas.

2. Persona Snapshot

Persona Attribute	Documented Context
Role	Authenticated User
User Context	Fitness enthusiast who exercises regularly.
Current Tracking Method	Manual records using notebooks and spreadsheets.
Primary Activities	Register/login, manage workouts, view workout history, search workouts, request AI recommendations and fitness insights.
Key Need	Organized workout tracking and guidance aligned with fitness goals and experience level.
System Interaction	Uses protected REST APIs and receives JSON responses through a client such as a React application, mobile application or Postman.

3. Empathy Map Canvas

The following canvas distinguishes directly documented user circumstances from reasonable persona-level inferences derived from the stated problems, usage patterns and expected system outcomes. The map is intentionally limited to the project document's scope.

THINKS • Needs a more organized way to maintain workout history. • Wants to understand whether exercise habits align with fitness goals. • Needs guidance on workouts appropriate to current fitness level. • Wants access to personal workout information without relying on scattered manual records.	FEELS • Finds manual organization of workout history difficult. • Experiences difficulty monitoring progress effectively. • Lacks confidence in selecting workouts without professional guidance. • May value greater clarity and convenience from structured tracking and AI assistance.
SAYS • I want to keep my workout records organized. • I need to find previous workouts efficiently. • I want recommendations suited to my age, fitness goal and experience. • I want insights into my workout performance.	DOES • Exercises regularly. • Records workouts using notebooks and spreadsheets. • Registers and logs into the application. • Creates, views, searches, updates and deletes workout records. • Requests AI workout recommendations and fitness insights.
PAINS • Difficulty maintaining a centralized workout record. • Manual tracking can produce inaccurate workout history. • No secure authentication for personal fitness records in the described problem context. • Difficulty searching previous workouts efficiently. • Lack of personalized workout recommendations. • Lack of overall workout performance insights. • Manual calculation of calories burned and workout duration is time-consuming.	GAINS • Centralized workout records. • Secure registration, login and protected access. • Easy retrieval and search of workout history. • Ability to update and delete workout records. • Personalized workout plans and weekly exercise suggestions. • Fitness performance analysis and improvement suggestions. • Motivational guidance and safety recommendations.

4. Empathy-to-Solution Traceability

User Need / Pain	FitTrack AI Capability	Documented Outcome
Organize workout history	Workout CRUD + MongoDB persistence	Centralized workout management.
Protect personal records	JWT + bcrypt + protected APIs	Only authenticated users can access protected resources.
Find historical workouts	Workout search	Search using workout name, category or date.
Choose suitable workouts	Gemini AI recommendations	Personalized workout plan, weekly suggestions, training guidance and safety tips.
Understand workout performance	AI fitness insights	Performance analysis, improvement suggestions, motivational advice and progress summary.
Reduce manual tracking effort	Structured workout records	Workout duration and calories burned are stored as defined workout data.

5. Persona Scope & Assumptions

The project document explicitly states that the backend supports one primary role: Authenticated User. Consequently, this empathy map does not introduce administrators, trainers, doctors, nutritionists, coaches, or other user personas. Statements under “Thinks,” “Feels,” and “Says” are persona-level interpretations derived from the documented case study and system problems; they are not quoted user research findings.

6. Key Empathy Insight

The documented user journey moves from manual and difficult-to-organize workout tracking toward centralized, authenticated workout management, followed by search and AI-assisted recommendations and insights. The system therefore addresses both record-management needs and the user’s need for more personalized fitness guidance.

Prepared exclusively from the supplied Main Project Document. Persona interpretations are explicitly distinguished from documented facts.
